
ENVIRONMENT FRIENDLY PROJECT: THE E.C.O.

Pollution and many “non-eco environment inventions” have become one of the biggest problems for the environment and the world we live on today. Even the many simple things like littering or even just taking a ride around town in the car, many may not notice but this is very hurtful for the environment. It’s our job we take care of this problem and help the environment and encourage people to be “more green”. This is why my team and I have thought of a solution, the E.C.O; the environment carer’s organization.

This organization we are working on aims to make the world a better place to live, with clean streets and little pollution. We aim to gather up interested young people and help clean the environment in different ways and tactics which include; litter picking groups which clean the environment and encourage others and pass-byers to do the same; posters and flyers which encourage people to stop the use of cars, instead walk or cycle if possible, or use electric cars if in need to travel distances; buying products and clothes made from recycled paper and plastic; or even future eco robots that will help clean the environment and stop pollution.

My team and I have extraordinary ideas to begin with, we are aiming to start off with mini smog vacuum cleaners around the streets which are crowded with cars and around factories to reduce the pollution, in addition with small teams who clean the town and encourage people in helping them with our green future ideas. We plan to make a club for people of all ages and discuss the problems and how they will be solved, and any new ideas that will help reduce major problems like climate change, which is caused by burning fossil fuels, deforestation, and emissions of greenhouse gasses. We are aiming high to achieve the attention of all people to this problem, stop it, and use renewable energy instead.

Not only thinking of ourselves, we have also other inhabitants in mind, from the largest of animals to the smallest of insects, we plan to appoint a group of our members into taking action of removing any plastic or other harmful materials from their habitat, saving any injured or troubled animals, and leaving food and water for them close by. In addition, we will take care of all types of plants, including flowers, vegetable plants, fruit plants, and pollinator-friendly plants. We target to have a gardening section in our organization for plant lovers and gardeners, and others interested. In this club we scheme to make a large compost area so we can use an organic fertilizer.

Unfortunately, during this hard time in 2021, some of this organization would have to be cancelled until further notice; however we have many ideas that can be done without even leaving your house. For example; the gardening group. We plan that at a fixed time every day the team have online meetings and discussions and plant a plant. We also agree for the team to make a gardening series on YouTube to teach and help other people how to garden.

Overall, our main aim is to make the environment a healthy green place to be in, and encourage people to get involved. We hope the results will be a big difference, were the world will change to the best, with new environment healthy robots, less use of cars, less pollution, use of renewable energy, decrease climate change, cleaning the place, and plants being planted. We are all very keen to see this project at work, and see the world change.
